

Data Review in DHIS2

Introduction to DHIS2

My notes

Narration

My notes

Narration

Once we have our data entered into the platform, how can we check the data's accuracy and reliability?

In this video, you will see...

Data Quality app

Validation rule
analysis

Outlier
analysis

Follow-up
analysis

My notes

Narration

In this video, we will explore several tools in the DHIS2 data quality app that will help us to review and improve the quality of our data

Data quality app

Validation rule analysis

My notes

Narration

First, in the Data Quality app, you can run a Validation rule analysis, which tests validation rules against the data registered in the system.

DHIS2 Aggregate Fundamentals V2 - Data Quality

Validation Rule Analysis

Outlier detection

Follow-Up Analysis

Validation Rule Analysis

Download as PDF Download as XLS Download as CSV

Organisation Unit	Period	Importance	Validation Rule	Value	Operator	Value	Details
Angelfish Private Hospital	2021-08-18	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	71.00	<=	20.00	
Bambi Dispensary	2021-08-18	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	79.00	<=	23.00	
Angelfish Private Hospital	2021-08-18	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	71.00	<=	20.00	
Bambi Dispensary	2021-08-18	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	79.00	<=	23.00	
Angelfish Private Hospital	2021-08-19	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	73.00	<=	22.00	
Bambi Dispensary	2021-08-19	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	81.00	<=	38.00	
Angelfish Private Hospital	2021-08-19	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	73.00	<=	22.00	
Bambi Dispensary	2021-08-19	MEDIUM	Ventilators occupied should be less than or equal to total number of ventilators	81.00	<=	38.00	

My notes

Narration

After running the check, you will get a report with a list of data that need to be checked. For example, if we look at the first row, our validation rule says that ventilators occupied should be less than or equal to the total number of ventilators. But the value registered for ventilators occupied is 71, while the value of number of available is 20. We can follow up with this location to determine the specific source of the error.

Note that you can also run the validation rule analysis during the data entry process.

Outlier Analysis

Outlier Analysis

- Standard normal distribution
- Minimum maximum values

My notes

Narration

The outlier analysis is another tool we can use to check data quality. It can identify values that are potential outliers when compared to the standard normal distribution of the data under review, or it can check the data against a pre-defined minimum and maximum value range. If the data fall outside that range, it will be identified as a potential outlier.

Narration

Like in the validation rule analysis, when we run an outlier analysis, we get a report with all the data that need to be checked.

For example, in this row, the data indicate 767 antenatal clients had their blood pressure checked in to this health facility, and this value of 767 falls outside of the normal distribution of these data and has been identified as a potential source of error.

My notes

Follow-up analysis

Follow-up analysis

List of data values
marked for follow-up

My notes

Narration

The third and final tool available in the Data Quality App is the Follow-up analysis tool. Follow-up analysis creates a list of all data values marked for follow-up.

Follow-up analysis

List of data values marked for follow-up:

My notes

Narration

We can mark a data value for follow-up in the Data Entry app and the Data Quality app via the reports from the outlier analysis tool.

Narration

This is an example of the report obtained after running a follow-up analysis in DHIS2.

My notes

WHO Data Quality Tool

WHO Data Quality
Review Framework

=

Narration

In coordination with WHO, a Data Quality tool for DHIS2 has also been created. This app generates findings on data quality following WHO's Data Quality Review Framework.

My notes

WHO Data Quality Tool

WHO Data Quality Review Framework

- Completeness
- Timeliness
- Internal consistency
- External consistency

My notes

Narration

This includes completeness, that is, if all the expected data are recorded; timeliness, or if the data was received on time, internal consistency, which compares internally submitted data with one another, and external consistency, which compares the data with other sources such as surveys

DEMO

My notes

Narration

As an example, we can review internal consistency. The WHO Data Quality tool allows us to identify outliers within our data. We can see an example of this in District C-1, where the number of Measles vaccines given in January 2020 is much higher in comparison to the other values reported within the same district in the same year.

Example of internal consistency

Region	Unit	Data	Jan 19	Feb 19	Mar 19	Apr 19	May 19	Jun 19	Jul 19	Aug 19	Sep 19	Oct 19	Nov 19	Dec 19	Weight ⓘ

Narration

This helps us easily visualize what data need to be double-checked before running any analysis.

My notes

Summary

- Tools in the DHIS2 Data Quality app
 - ✓ Validation rules
 - ✓ Outlier analysis
 - ✓ Follow-up analysis
- WHO Data Quality Tool:
 - ✓ Completeness
 - ✓ Timeliness
 - ✓ Internal consistency
 - ✓ External consistency

My notes

Narration

In summary, in DHIS2 there are several tools that help us to check the quality of the data entered, such as validation rules, outlier analysis, and follow-up analysis. DHIS2 and WHO have also collaborated to create a Data Quality tool that runs checks to validate completeness, timeliness, internal consistency, and external consistency.
